                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a conjugate (I) and its salts. (I) has the formula CT-LI-Sp1-Sp2-K, where: CT = cytotoxic radical or radical of a cytostatic derivative optionally also carrying a OH, COOH or NH2 group; LI = linker comprising 5 to 8 amino acids each optionally carrying protecting groups; Sp1 = absent, CO or CS; Sp2 = optionally substituted arylene or alkylene; and K = unsubstituted or regioselectively modified carbohydrate radical. Also described: (1) a process for preparation of the conjugates; (2) a medicament comprising the conjugate. (I) has cytostatic activity. The conjugates are useful for treating cancer. The conjugate is cleaved by enzymes found especially in tumour tissue to release the cytotoxic drug. As the drug is not active until after cleavege it will not cause harm to non-tumour proliferating cells,
to sleepiness, e.g. sleep apnoea, narcolepsy, idiopathic hypersomnia and psychogenic hypersomnia. PrRP receptor antagonists are useful for promoting sleep and for treating insomnia such as adjustment sleep disorder and psychophysiologic insomnia. The present sequence is human GPR10 mutant C-terminal peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              therefore reducing the side-effects associated with the use of such drugs. The present sequence represents a camptothecin peptide conjugate, which is used in an example from the present invention

The protein and its encoded DNA are applicable in studying the molecular mechanism of expression neuroplasticity and pathosis of neurodegeneration. The present sequence represents the a peptide of the
                                                                                                                                                                                                                                                                                                                                                                                                                             Brain-occurring ubiquitin-specific protease and encoded DNA, applicable in studying molecular mechanism of expression neuroplasticity and pathosis of neurodegeneration.

                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                    The invention relates to novel methods for producing polypeptide-tagged collections and capture systems containing the tagged polypeptides. The method is useful for evenly distributing tags among members of a starting library. The system, collection, kits and methods are useful in developing pharmaceuticals and diagnostics. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                   Evenly distributing tags among members of a starting library, useful developing pharmaceuticals and diagnostics, comprises dividing the starting library into sub libraries and attaching a tag to members of each sub library.
                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                               The invention relates to novel methods for producing polypeptide-tagged collections and capture systems containing the tagged polypeptides. The method is useful for evenly distributing tags among members of a starting library. The system, collection, kits and methods are useful in developing pharmaceuticals and diagnostics. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to novel methods for producing polypeptide-tagged collections and capture systems containing the tagged polypeptides. The method is useful for evenly distributing tags among members of a starting library. The system, collection, kits and methods are useful in developing pharmaceuticals and diagnostics. The present sequence is used

                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to novel methods for producing polypeptide-tagged collections and capture systems containing the tagged polypeptides. The method is useful for evenly distributing tags among members of a starting library. The system, collection, kits and methods are useful in developing pharmaceuticals and diagnostics. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                    Evenly distributing tags among members of a starting library, useful developing pharmaceuticals and diagnostics, comprises dividing the starting library into sub libraries and attaching a tag to members of each sub library.

The invention relates to novel methods for producing polypeptide-tagged collections and capture systems containing the tagged polypeptides. The method is useful for evenly distributing tags among members of a starting library. The system, collection, kits and methods are useful in developing pharmaceuticals and diagnostics. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Evenly distributing tags among members of a starting library, useful in developing pharmaceuticals and diagnostics, comprises dividing the starting library into sub libraries and attaching a tag to members of each sub library.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                     collections and capture systems containing the tagged polypeptide-tagged method is useful for evenly distributing tags among members of a starting library. The system, collection, kits and methods are useful in developing pharmaceuticals and diagnostics. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method for the capture and analysis of biological particle using a capture system. The method is useful for capturing biological particles such as cells, portions of cells, cell membranes, viruses, viral capsids, viral particles, bacterial cells, subcellular compartments, organelles and micelles, prokaryotic cells, eukaryotic cells, intracellular particles, nuclei, cell membranes, cell membrane fragments, nuclear membranes fragments, viral vectors or viral capsids with or without packaged nucleic acid, phage, phage vectors, phage capsids with or without encapsulated nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Capturing biological particles, by contacting biological particles with capture system comprising addressed loci, addressed collection of polypeptide tagged molecules, capture agents, and polypeptide tag to which capture agent binds.
                                             developing pharmaceuticals among members of a starting library, useful state oping pharmaceuticals and diagnostics, comprises dividing the starting library into sub libraries and attaching a tag to members of each sub library.
                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

cells chosen from immune cells, neurons, cancer cells, bacterial cells and infected cells, subcellular compartment, organelles, viral particles or pathogens. The cells are dendritic cells, T cells, or B cells. The method is also useful for identifying molecules that interact with infectious agents, for profiling the surface of a biological particle, for identifying molecules that modulates the biological particle, for identifying molecules that modulates the considerable in the biological particle, and for mapping epitopes of molecules displayed on the surface of a biological particles. The method is also useful for sorting biological particles, for identifying a receptor on the surface of biological particle that transduces a signal from a polypeptide, and for molecule that interacts with an apically-localized molecule on a biological particle. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method for the capture and analysis of biological particle using a capture system. The method is useful for capturing biological particles such as cells, portions of cells, cell membranes, viruses, viral capsids, viral particles, bacterial cells, subcellular compartments, organelles and micelles, prokaryotic cells, eukaryotic cells, intracellular particles, nuclei, cell membranes, cell membrane fragments, nuclear membranes, nuclear membranes fragments, viral vectors or viral capsids with or without packaged nucleic acid, phage, phage vectors, phage capsids with or without encapsulated nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Capturing biological particles, by contacting biological particles with capture system comprising addressed loci, addressed collection of polypeptide tagged molecules, capture agents, and polypeptide tag to
                                                                                                                                                                                                                                                                                                                                                                                                                                            Gape

cells chosen from immune cells, neurons, cancer cells, bacterial cells and infected cells, subcellular compartment, organelles, viral particles cor pathogens. The cells are dendritic cells, T cells, or B cells. The cethod is also useful for identifying molecules that interact with infectious agents, for profiling the surface of a biological particles, for identifying molecules that modulates the corresponding in the biological particle, for identifying molecules that modulates the cafficking, activity or functional or structural property in the biological particle, and for mapping epitopes of molecules displayed on the surface of a biological particles. The method is also useful for sorting biological particles, for identifying a receptor on the surface of biological particles, for identifying a receptor on the surface of biological particles. The method is also useful for sorting biological particles, for identifying a receptor on the surface of biological particle that transduces a signal from a polypeptide, and molecule on a biological particle. The present sequence was used to illustrate the invention.

particles with 50 Capturing biological particles, by contacting biological particles capture system comprising addressed loci, addressed collection of polypeptide tagged molecules, capture agents, and polypeptide tag which capture agent binds.

NO 964; SOSpp; English Disclosure; SEQ ID The present invention relates to a method for the capture and analysis of biological particle using a capture system. The method is useful for capturing biological particles such as cells, portions of cells, cell membranes, viruses, viral capsids, viral particles, bacterial cells, subcellular compartments, organelles and micelles, prokaryotic cells, eukaryotic cells, intracellular particles, nuclei, cell membranes, cell membrane fragments, nuclear membranes fragments, viral vectors or viral capsids with or without packaged nucleic acid, phage, phage vectors, phage capsids with or without encapsulated nucleotide

The method is also useful for sorting biological particles, for identifying a receptor on the surface of biological particles, for identifying a receptor on the surface of biological particle that transduces a signal from a polypeptide, and for identifying the molecule that interacts with an apically-localized molecule on a biological particle. The present sequence was used to
                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a method for the capture and analysis of biological particle using a capture system. The method is useful for capturing biological particles such as cells, portions of cells, cell membranes, viruses, viral capsids, viral particles, bacterial cells, subcellular compartments, organelles and micelles, prokaryotic cells, eukaryotic cells, intracellular particles, nuclei, cell membranes, cell membrane fragments, nuclear membranes, nuclear membranes fragments, viral vectors or viral capsids with or without packaged nucleic acid, phage, phage vectors, phage capsids with or without encapsulated nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     capturing biological particles, by contacting biological particles with capture system comprising addressed loci, addressed collection of polypeptide tagged molecules, capture agents, and polypeptide tagged which capture agent binds.
                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Capturing biological particles, by contacting biological particles with capture system comprising addressed loci, addressed collection of polypeptide tagged molecules, capture agents, and polypeptide tag to which capture agent binds.

NO 240; 505pp; English Disclosure; SEQ ID

The present invention relates to a method for the capture and analysis of biological particle using a capture system. The method is useful for capturing biological particles such as cells, portions of cells, cell membranes, viruses, viral capsids, viral particles, bacterial cells, subcellular compartments, organelles and micelles, prokaryotic cells, eukaryotic cells, intracellular particles, nuclei, cell membranes, cell membrane fragments, nuclear membranes fragments, viral vectors or viral capsids with or without packaged nucleic acid, phage, phage vectors, phage capsids with or without encapsulated nucleotide

acid, liposomes and other micellar agents. The biological particles are cells chosen from immune cells, neurons, cancer cells, bacterial cells and infected cells, subcellular compartment, organelles, viral particles or pathogens. The cells are dendritic cells, T cells, or B cells. The method is also useful for identifying molecules that interact with infectious agents, for profiling the surface of a biological particle, for identifying molecules that modulates the biological particle, for identifying molecules that modulates the crafficking, activity or functional or structural property in the biological particle, and for mapping epitopes of molecules displayed on the surface of a biological particles. The method is also useful for sorting biological particles, for identifying a receptor on the surface of biological particles, for identifying a receptor on the surface of biological particle that transduces a signal from a polypeptide, and confidentifying the molecule that interacts with an apically-localized molecule on a biological particle. The present sequence was used to illustrate the confidential particle. The present sequence was used to also a signal from a biological particle. The present sequence was used to also and also an illustrate the invention

Sequence 12, Application US/07729099

Patent No. 5403581

GENERAL INFORMATION:

APPLICANT: Binger, Mary-Helen

APPLICANT: Basamontes, Luis

TITLE OF INVENTION: Coccidiosis Vaccines

NUMBER OF SEQUENCES: 15

CORRESPONDENCE ADDRESS:

ADDRESSE: Hoffmann-La Roche Inc.

STREET: 340 Kingsland Street

CITY: Nutley

STATE: New Jersey

COUNTRY: U.S.

ZIP: 07110

COMPUTER READABLE FORM:

MEDIUM TYPE: IBM PC Compatible

COMPUTER: PatentIn Release #1.0, Version #1.25

CURRENT APPLICATION DATA:

APPLICATION NUMBER: US/07/729,099

FILING DATE: 19910712

CLASSIFCATION: 424

FILING DATE: TUDDAMATION: ACTANT INFORMATION:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match 91.3%; Score 21; DB 1; Le Best Local Similarity 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 18
US-09-112-956-1
; Sequence 1, Application US/09112956
; Patent No. 6750025
; GENERAL INFORMATION:
; APPLICANT: Hammond, David
; APPLICANT: Medina, Emma
; TITLE OF INVENTION: A NOVEL METHOD OF DETECTING AND ISOLATING PRION
; TITLE OF INVENTION: DIAGNOSING AND TREATING PRION DISEASES
; FILE REFERENCE: 92053/26
; CURRENT APPLICATION NUMBER: US/09/112,956
; CURRENT FILING DATE: 1998-07-09
; NUMBER OF SEQ ID NOS: 6
; SOFTWARE: PATENTIN Version 3.0
; SEQ ID NO 1

RESULT 20
US-09-510-738A-102
; Sequence 102, Application US/09510738A
; Patent No. 6268165
; GENERAL INFORMATION:
; APPLICANT: O'Brien, Timothy J.
; TITLE OF INVENTION: Compositions and Methods for the Early Diagnosis of
; TITLE OF INVENTION: Ovarian Cancer
; FILE REFERENCE: D6223CIP-A
; CURRENT APPLICATION NUMBER: US/09/510,738A
; CURRENT FILING DATE: 2000-02-22
; PRIOR APPLICATION NUMBER: 09/039,211
; PRIOR FILING DATE: 03-14-1998
; NUMBER OF SEQ ID NOS: 188
; SEQ ID NO 102
; LENGTH: 9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gарв

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           US-09-861-966-102
US-09-861-966-102
US-09-861-966-102

Sequence 102, Application US/09861966

Patent No. 6518028

GENERAL INFORMATION:

TITLE OF INVENTION: Compositions and Methods for the Early Diagnosis of TITLE OF INVENTION: Ovarian Cancer

FILE REFERENCE: D6223CIP-A/Div

CURRENT PFLING DATE: 2001-05-21

PRIOR FILING DATE: 2000-02-22

NUMBER OF SEQ ID NOS: 188

SEQ ID NO 102

LENGTH: 9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 144, Application US/09510738A

Sequence 203, Application US/10806924

Publication No. US20050095648A1

GENERAL INFORMATION:

APPLICANT: Geysen, H. Mario

APPLICANT: Geysen, H. Mario

APPLICANT: Ault-Riche, Dana

TITLE OF INVENTION: Method for designing linear epitopes

TITLE OF INVENTION: and polypeptide epitopes

FILE REFERENCE: 25885-1760

CURRENT APPLICATION NUMBER: US/10/806,924

CURRENT FILING DATE: 2004-03-22

NUMBER OF SEQ ID NOS: 911

SOFTWARE: FastSEQ for Windows Version 4.0

SEQ ID NO 203

LENGTH: 6

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

AG0927
probable phage tail protein [imported] - Salmonella enterica subsp. enterica serovar Typl
c;Species: Salmonella enterica subsp. enterica serovar Typhi
C;Species: Salmonella enterica subsp. enterica serovar Typhi
A;Note: this species has also been called Salmonella typhi
C;Date: 09-Nov-2001 #sequence_revision 09-Nov-2001 #text_change 18-Nov-2002
C;Accession: AG0927
C;Accession: AG0927

B31048
phosphotransferase system enzyme II (EC 2.7.1.69), mannitol-specific, factor III - Staph
NiAlternate names: phosphotransferase system enzyme III, mannitol-specific
C; Species: Staphylococcus carnosus
C; Date: 15-Dec-1988 #sequence_revision 15-Dec-1988 #text_change 09-Jul-2004
C; Accession: B31048
R; Reiche, B.; Frank, R.; Deutscher, J.; Meyer, N.; Hengstenberg, W.
Biochemistry 27, 6512-6516, 1988
A; Title: Staphylococcal phosphoenolpyruvate-dependent phosphotransferase system: purific
Carnosus and homology with the enzyme II(mtl) of Escherichia coli.
A; Reference number: A31048
A; Reference number: A31048
A; Accession: B31048
A; Accession: B31048
A; Readus: preliminary
A; Molecule type: protein
A; Readus: 1-67 aREI>
A; Cross-references: UNIPROT:P17876
C; Keywords: phosphotransferase system mannitol-specific enzyme II factor III; phosphot C; Keywords: phosphotransferase system mannitol-specific enzyme II factor III homolog
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .;

The hemolymph of the honeybee Apis mellifera.";

Biochemistry 26:1885-1889(1987).

-!- FUNCTION: Unknown (it might play a role in lipid transport and/or storage protein metabolism during metamorphosis).

-!- SUBUNIT: Homodimer.

-!- SUBCELLULAR LOCATION: Extracellular.

-!- SUBCELLULAR LOCATION: Extracellular.

-!- TISSUE SPECIFICITY: Hemolymph.

-!- DEVELOPMENTAL STAGE: Present in high amounts in hemolymph only at the end of larval life.

"Purification, characterization, and partial sequencing of two new allergens of Olea europaea.";

J. Allergy Clin. Immunol. 101:210-216(1998).

-I. FUNCTION: Destroys radicals which are normally produced within the cells and which are toxic to biological systems (By similarity).

-!- CATALYTIC ACTIVITY: 2 superoxide + 2 H(+) = O(2) + H(2)O(2).

-!- COFACTOR: Binds 1 copper ion and 1 zinc ion per subunit (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          01-NOV-1997 (Rel. 35, Created)
